

PROJECT:

CACT Nepsys Support

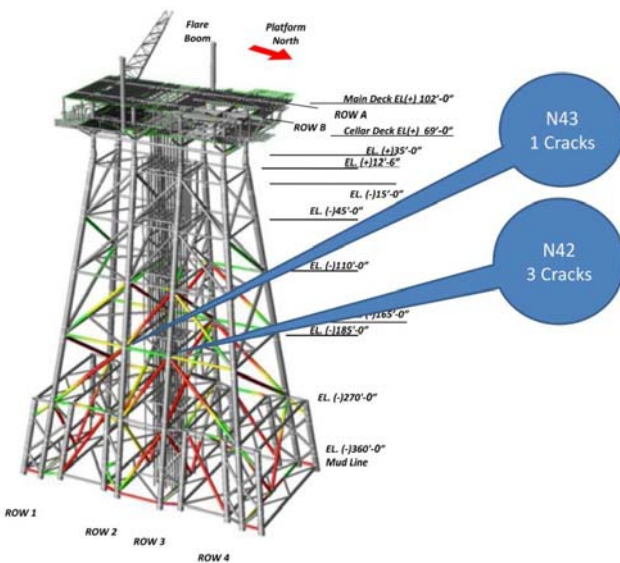

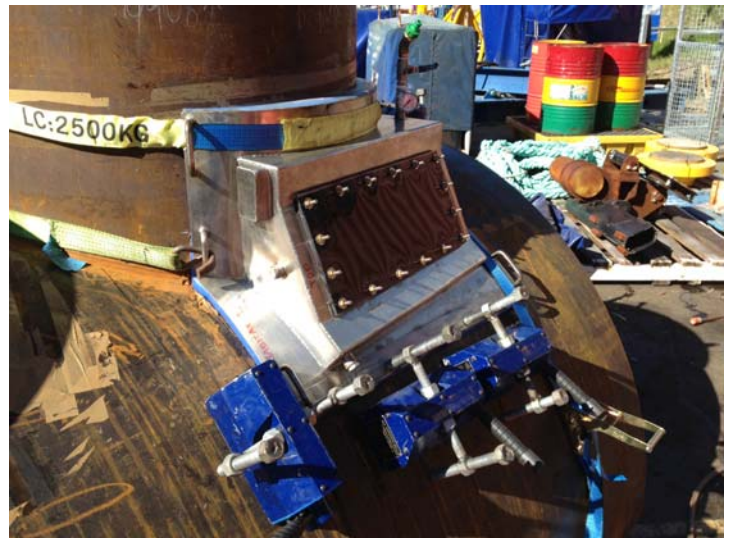

**under-promise
over-deliver**

CLIENT:
CACT Operators Group
LOCATION:
South China Sea, China
DATE:
2013

CACT was faced with the issue of subsea fatigue cracks in some Jacket joints on a platform in Bohai Bay, China. CACT wished to engage Neptune and their underwater weld repair technology but needed expert advice and management support while the technology was prequalified and the equipment mobilised to China.

CACT engaged Linch-pin to assist them with technical and management support and to assure the delivery of the desired outcome against a fast track project. Linch-pin further added value by enabling independent assessment of the NDT records upon which repair decisions were made. Ultimately the pre-qualification and mobilisation were executed as desired. However, the independent assurance enabled CACT to reinterpret the defects and avoid the need to actually implement the repairs.
